

PEPPER, BELL (*Capsicum annuum*)
Phytophthora blight, *Phytophthora capsici*

C.A. Wyenandt, W.L. Kline and N. Maxwell
Rutgers Agric. Res. and Ext. Center
121 Northville Rd. Bridgeton, NJ 08302

Evaluation of pepper breeding lines and cultivars for Phytophthora-tolerance and skin separation, 2007.

These experiments, arranged as a randomized complete block design with 4 replications, were conducted in a field naturally- and artificially-infested with *Phytophthora capsici* at the Rutgers Agricultural Research and Extension Center (RAREC), Bridgeton, New Jersey and in a field naturally-infested with Phytophthora at the Martino farm in Vineland, New Jersey. Bell pepper seeds were obtained from cooperating agencies, treated on 3 April with a solution of 4 parts water to 1 part Clorox and seeded on 4 April. On 15 May at the on-farm site, twenty one bell pepper breeding lines or cultivars were transplanted by hand with into single rows (18" apart in row) on one-foot high, bare-soil beds (9 plants per plot) on 3 ft centers. On 15 May at RAREC, nine bell pepper breeding lines or cultivars were hand transplanted into double rows (18" in row) on black plastic mulch on 5 ft centers (18 plants per plot) with drip irrigation. At both sites, all treatment plots were 15 ft long, with guard rows of Phytophthora-susceptible bell pepper 'Camelot' planted on the outside of plots at RAREC. Fertility schedule and management of insect and weeds were done according to local recommendation guidelines. Each week, the number of Phytophthora-infected plants (out of a total number of 18) were counted and recorded from each plot. On 31 Aug, ten randomly selected fruit from all breeding lines or cultivars were rated for shoulder recess, fruit color, fruit shape, fruit smoothness, fruit gloss, uniformity, number of lobes, fruit length and width, and fruit wall thickness. All mature pepper fruit from 15 ft of each treatment row were harvested on 13 July, 25 July, 9 Aug, 30 Aug, 21 Sept, and 23 Oct at RAREC and on 24 July, 10 Aug, 24 Aug, 14 Sept, and 8 Oct at the Martino farm. All fruit were graded, separated and weighed for statistical analysis. Rainfall (inches) for the months of June, July, August and September were 2.34, 2.02, 3.13, and 0.53 in. at RAREC and 2.77, 3.74, 3.73 and 3.73 in. at the on-farm site.

At RAREC, percent of Phytophthora-infected plants at last harvest ranged from 1.4% to 97.2% depending on breeding line or cultivar. Percent silvering for combined harvest data ranged from 1 to 33% depending on breeding line or cultivar. Of all breeding lines evaluated at RAREC, Syngenta 18655 performed the least in phytophthora-tolerance (97% infected) and boxes/A (225 total). Total percent silvering was lowest in Seminis 0994-3089 at 1% compared to 33% in Syngenta 18659. Marketable yield (total boxes/A) varied significantly depending on breeding line and cultivar. Yield was highest in Seminis 994-3084 at 507 boxes/A, followed by Seminis 994-1819 at 414, Syngenta 18654 at 388 and Seminis 994-3089 at 360. Yield was significantly lower in breeding line Syngenta 18655 at 225 boxes/A.

At the on-farm site, percent of Phytophthora-infected plants at last harvest ranged from 0 to 100% depending on breeding line or cultivar. Percent silvering for combined harvest data ranged from 0.4 to 24% depending on breeding line or cultivar. The lowest percentage of phytophthora-infected plants included Syngenta breeding lines 18660, Paladin and 18658 at 0, 3 and 14%. Percent phytophthora-infected plants were highest in Camelot at 100%, Alliance at 91%, Syngenta 18659 at 86%, Harris Moran HMX-6646 at 81% and Syngenta 18655 at 69%. Total percent silvering was lowest in Harris Moran Alliance at 0.4% compared to 3% in phytophthora-tolerant cultivar Paladin. Marketable yield (total boxes/A) varied significantly depending on breeding line and cultivar. Highest yielding breeding lines included Harris Moran Revolution, Syngenta 18660, Seminis 994-3089, Seminis 993-1126B, and Syngenta Paladin. Lowest yielding was Syngenta 18653.

As noted from previous research trials and in this study, the more tolerance a bell pepper cultivar or breeding line has to the crown rot phase of phytophthora blight, the more likely skin separation, or 'silvering', is to develop in its fruit.

Declaration (HMX-7648)	4	4	4	5	6	0.90	3	0	3.1

^zfruit color ratings: 1 = dark green, 3 = medium dark green, 5 = medium green, 7 = medium light green, 9 = slight green

^yfruit shape ratings: 1 = linear, 2 = round, 3 = oblate, 4 = blocky, 5 = conical blunt, 6 = conical elongated

^xfruit smoothness ratings: 1 = rough, 9 = smooth

^wfruit gloss ratings: 1 = dull, 9 = shiny

^vuniformity ratings: 1 = not uniform, 5 = medium uniform, 9 = uniform

^ulength and width is a ratio calculated as an average of four length ratings (in cm) from each replication divided by four width ratings (in cm) from each replication

^tshoulder recess ratings: 1 = none, 5 = medium, 9 = deep

^sthe number of fruit out of ten that had silvering

^rthe number of lobes when fruit is cut in half

Table 15. Pepper characteristics of ten randomly selected fruit from twenty one breeding lines or cultivars at RAREC in 2007.
